Received April 1, 2020; accepted June 1, 2020

ABSTRACT

There are many gaps in scientific knowledge about the clinical significance of pharmacokinetic natural product–drug interactions (NPDIs) in which the natural product (NP) is the precipitant and a conventional drug is the object. The National Center for Complimentary and Integrative Health created the Center of Excellence for NPDI Research (NaPDI Center) (www.napdi.org) to provide leadership and guidance on the study of pharmacokinetic NPDIs. A key contribution of the Center is the first user-friendly online repository that stores and links pharmacokinetic NPDI data across chemical characterization, metabolomics analyses, and pharmacokinetic in vitro and clinical experiments (repo.napdi.org). The design is expected to help researchers more easily arrive at a complete understanding of pharmacokinetic NPDI research on a particular NP. The repository will also facilitate multidisciplinary collaborations, as the repository links all of the experimental data for a given NP across the study types. The current work describes the design of the repository, standard operating procedures used to enter data, and pharmacokinetic NPDI data that have been entered to date. To illustrate the usefulness of the NaPDI Center repository, more details on two high-priority NPs, cannabis and kratom, are provided as case studies.

SIGNIFICANCE STATEMENT

The data and knowledge resulting from natural product–drug interaction (NPDI) studies is distributed across a variety of information sources, rendering difficulties to find, access, and reuse. The Center of Excellence for NPDI Research addressed these difficulties by developing the first user-friendly online repository that stores data from in vitro and clinical pharmacokinetic NPDI experiments and links them with study data from chemical characterization and metabolomics analyses of natural products that are also stored in the repository.

Introduction

Natural products (NPs) include herbal and other botanical products (Paine and Roe, 2018). Pharmacokinetic interactions involving NPs and conventional [e.g., approved by the US Food and Drug Administration (FDA)] drugs could result in reduced treatment efficacy or adverse effects (Paine et al., 2018). Although up to 88% of older adults use herbal medicinal products concurrently with conventional drugs (Batanero-Hernán et al., 2017), there are many gaps in scientific knowledge about the clinical significance of pharmacokinetic NP–drug interactions (NPDIs) in which the NP is the precipitant and a conventional drug is the object. Although 6 of the 40 top-selling herbal medicinal products in 2017 were implicated in clinically significant pharmacokinetic NPDIs, there was minimal or no supporting clinical evidence for potential NPDIs involving nine products (Spanakis et al., 2019). Similarly, data were insufficient to conclude the clinical relevance of 11 of the 15 potential pharmacokinetic NPDIs involving antiretroviral drugs (Fasinu et al., 2015).

This work was funded by National Institutes of Health National Center for Complementary and Integrative Health [Grant U54 AT008909].

ABBREVIATIONS: CBD, cannabidiol; FAIR, findable, accessible, interoperable, and reusable; FDA, US Food and Drug Administration; NaPDI Center, Center of Excellence for Natural Product–Drug Interaction Research; NP, natural product; NPDI, NP-drug interaction; P450, cytochrome P450; SOP, standard operating procedure; THC, tetrahydrocannabinol; UGT, UDP-glucuronosyltransferase.

There are several unique challenges associated with pharmacokinetic NPDI research, including the large variability of phytoconstituents among marketed products, difficulty extrapolating results from animal and/or in vitro models to humans, variability in study design, and inadequate methods (Paine et al., 2018). Based on these knowledge gaps and challenges, the National Center for Complimentary and Integrative Health created the Center of Excellence for NPDI Research (NaPDI Center; www.napdi.org) to provide leadership and guidance on the study of pharmacokinetic NPDIs (Paine et al., 2018).

One objective of the NaPDI Center is to develop and apply a set of Recommended Approaches to determine the clinical relevance of pharmacokinetic NPDIs (Johnson et al., 2018; Paine et al., 2018; Kellogg et al., 2019). A key deliverable of the Center is the development of an online repository for data generated by the NaPDI Center (repo.napdi.org). The repository combines data currently distributed across a variety of information sources into a single user-friendly format complemented by an information portal. This portal, also developed by the NaPDI Center, disseminates the Recommended Approaches (Johnson et al., 2018; Paine et al., 2018; Kellogg et al., 2019) on the optimal conduct of pharmacokinetic NPDI studies (napdicenter.org). Combined, these new resources will help advance pharmacokinetic NPDI research by providing Recommended Approaches and novel pharmacokinetic NPDI data.

Pharmacokinetic NPDI data include chemical characterization of NPs, metabolomics analyses, and in vitro and clinical pharmacokinetic experimental results. This new repository stores data from all of these types of investigations. It provides a user-friendly interface that enables users with limited informatics skills to effectively explore relevant data (Li, 2015). As of March 2020, coverage of the repository is limited to four carefully selected high-priority NPs based on a systematic method for the purpose of demonstrating the Recommended Approaches (Johnson et al., 2018): cannabis (*Cannabis sativa*), goldenseal (*Hydrastis canadensis*), green tea (*Camellia sinensis*), and kratom (*Mitragyna speciosa*). A prior Recommended Approach (Johnson et al., 2018) reported the inclusion of licorice (*Glycyrrhiza* spp.). The Center later replaced licorice with kratom to 1) keep pace with public health needs in the face of an ever-changing NP market (Gaston et al., 2020) and 2) omit redundancy with the research efforts of a longstanding botanical center (https://pcrps.pharmacy.uic.edu/our-centers/uic-nih-center-for-botanical-dietary-supplements-research/).

The current work describes the design of the repository, standard operating procedures (SOPs) used to enter data, and pharmacokinetic NPDI data that have been entered to date. To illustrate the usefulness of the NaPDI Center repository, more details on two high-priority NPs, cannabis and kratom, are provided as case studies.

Materials and Methods

Construction and Content

Studies Conducted by NaPDI Center Investigators. To date, the repository has focused on original pharmacokinetic NPDI research conducted by NaPDI Center investigators, who are organized into three cores with complementary expertise (Fig. 1).

The Analytical Core is composed of NP chemists, analytical chemists, and clinical pharmacologists and serves multiple functions. This core chemically characterizes multiple commercially available products of a given NP, determines the contents of constituents in these products, and provides guidance on the proper selection of one or more commercially available products to be tested by the Pharmacology Core. The core also analyzes plasma and urine samples obtained from pharmacokinetic clinical studies for NP constituents and object drugs.

The Pharmacology Core is composed of clinical pharmacologists and medicinal chemists. This core designs and conducts rigorous experiments to evaluate the potential for NPs to precipitate pharmacokinetic interactions with certain object drugs. The core also characterizes the pharmacokinetics of select NP constituents in human subjects. The data obtained are used to develop physiologically based pharmacokinetic models that can be applied to other object drugs and patient populations of interest. Figure 2 shows the variety of different experiment types that the repository supports to store data from the NaPDI Center's interaction projects.

The Informatics Core (Fig. 1) is composed of biomedical informaticists, computer scientists, and communication experts. This core compiles all data generated from NaPDI Center research activities into the data repository, which is accessible via the information portal. Prior to public release, NaPDI Center data are only accessible to researchers approved to access the site. Contributing researchers indicate when to make the data public. The data are made available according to a Recommended Approach for making pharmacokinetic NPDI research data findable, accessible, interoperable, and reusable (FAIR; https://www.w3id.org/hclscg/npdi).

Data Types. A variety of data types are produced from pharmacokinetic NPDI studies (Supplemental Table 1). Initially, the specification and subsequent characterization of the NP source materials generated a diverse set of data, including chromatograms from conventional high-pressure liquid chromatography with UV detection and ultrahigh-pressure liquid chromatography–mass spectrometry methods, spectral data from nuclear magnetic resonance and circular dichroism, and bioactivity fractionation data. These data include instrument tracings that are often not retrievable in digitized form. Hence, the scanned image files are archived in the repository. Quantitative data on NP source materials, such as content of individual phytoconstituents and specific impurities or contaminants, are organized in tabular format.

The types of data generated from in vitro NPDI studies vary across the range of human-derived in vitro test systems, including enzymatic reactions involving recombinant enzymes, human tissue fractions (e.g., human liver microsomes), or cultured cells (e.g., hepatocytes), and drug transport experiments measuring uptake into membrane vesicles or efflux from transfected cells. Currently, the data repository tracks 82 measurements for quantitative data resulting from NPDI experiments. The full list is provided in Supplemental Table 1. Included in the list are, for example, percent inhibition, IC_{50}, K_m, and V_{max}.

In addition, data generated from inhibition experiments involving drug metabolizing enzymes or transporters differ from those generated from induction experiments. Thus, the repository provides separate sets of data fields for each of these in vitro systems and mechanisms (Supplemental Table 1).

Pharmacokinetic data generated from clinical NPDI studies include human subject demographics, concentration-time data, and key pharmacokinetic endpoints (e.g., oral clearance, renal clearance, apparent volume of distribution, half-life, area under the plasma-concentration vs. time curve, maximum plasma concentration, and time to reach maximum concentration). Statistical analyses of primary and secondary pharmacokinetic endpoints generated additional data sets.

Data Findability, Accessibility, Interoperability, and Reusability. There is a growing recognition by both researchers and funding agencies that pharmacokinetic NPDI study data sets should be more FAIR (National Center for Complementary and Integrative Health, 2019). The NaPDI Center repository is designed to ensure that data satisfy these four foundational principles of good data management and stewardship. Table 1 summarizes the specific features of the repository that support FAIR pharmacokinetic NPDI data. Each feature is described in greater detail in a public and participative report that the NaPDI Center is developing in collaboration with the World Wide Web Consortium Semantic Web in Health Care and Life Sciences Community Group (https://www.w3id.org/hclscg/npdi).

Standard Operating Procedures for Data Entry. A major feature of the repository is that data are entered using validated SOPs. There are currently 11 SOPs, one for each experiment type listed in Figure 2. Data collection forms have been developed for both internal and external NPDI researchers, such as contract research organizations. These forms are based closely on the SOP documents. Both the SOPs and data entry forms are publicly available on GitHub (https://github.com/dbmi-pitt/NaPDI-SOPs), and the SOP document for enzyme inhibition experiment type is provided as an example in Supplemental Data (Boyce et al., 2020).

Quality Control and Validation Processes. Given the variety of data types, close attention must be paid to enable accurate tracking and meticulous organization of the generated data. The structure, data organization, and concepts effectively used by the University of Washington's Drug Interaction Database (Hachad et al., 2010), now Drug Interaction Solutions (www.druginteractionsolutions.org), have been

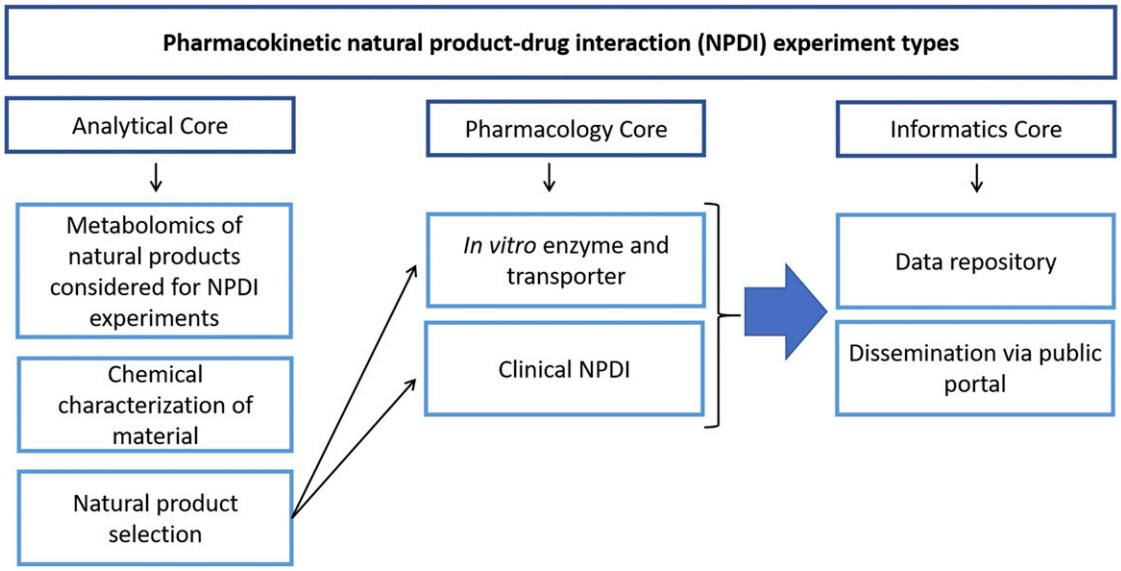

Fig. 1. Types of pharmacokinetic NPDI experiments conducted by the NaPDI Center.

applied to the NaPDI Center repository. These features have been validated over time with feedback from a large user base. To ensure the quality and consistency of the entry process, data are entered by experienced curators who are well versed in drug interactions using the aforementioned SOPs. All data entry undergoes review by a second reviewer prior to public release.

Current Status of the Repository. An overview of data entered into the NaPDI Center repository is provided for two of the high-priority NPs selected as case studies: cannabis (*C. sativa*) and kratom (*M. speciosa*). These NPs were chosen due to increasing use and public interest. Neither NP has been well studied with respect to NPDI potential. In the United States, a majority of states have legalized marijuana for recreational and/or medical purposes. Moreover, a growing number of products containing the nonpsychotropic phytocannabinoid cannabidiol are marketed every year. These products include the FDA-approved drug Epidiolex and numerous unapproved tinctures, oils, and extracts. Kratom, a member of the coffee family native to Southeast Asia, is touted for its analgesic and stimulant effects. Warnings about kratom toxicity have been raised by the US FDA and the Centers for Disease Control and Prevention (Food and Drug Administration, 2019; Gershman, 2019). Calls to US poison centers involving kratom exposures from 2011 to 2017 increased 52-fold, from 13 to 682, with more than one-third of the calls reported involving co-consumption with prescription or illicit drugs (Post et al., 2019).

Each case study begins with a summary of NaPDI Center research activities focusing on each NP as a precipitant of pharmacokinetic NPDIs. A description follows about how published evidence was added to the repository to both complement the data generated by the NaPDI Center and provide researchers with a more complete picture of the pharmacokinetic interaction potential for each NP.

NPDI Study Process. Four steps are crucial for conducting a rigorous research study on a given pharmacokinetic NPDI: NP selection; sourcing and chemical characterization of different commercial products of the selected NP; in vitro assessment of inhibition or induction of drug metabolizing enzymes and

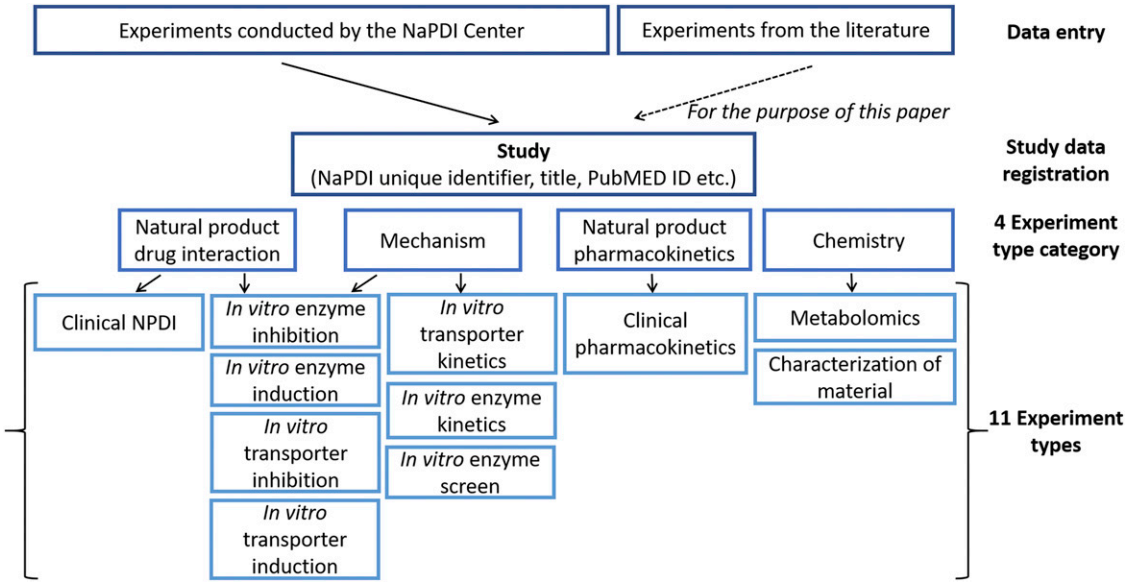

Fig. 2. Data resulting from experiments conducted by the NaPDI Center and from experiments reported in the literature are entered into the repository. Each "Study" record describes an activity that resulted in data from one or more related experiments. Each experiment record is assigned 1 of the 11 experiment types offered that provides the appropriate format for recording experimental conditions and results following instructions provided in the 11 SOPs.

TABLE 1

Data in the NaPDI Center repository are FAIR

FAIR	General
Findability	Each data set receives a unique identifier. Study and experiment metadata are published using a machine-readable format. The update frequency of the data is available for each study and experiment.
Accessibility	Full data sets are downloadable. Data are accessible in a variety of formats and can be retrieved using a REST-full API. The repository uses HTTP content negotiation to serve data requests. The repository search capabilities support simple search and advanced faceted search.
Interoperability	Data sets use data elements from existing ontologies and terminologies as much as possible. NMR and MS results are reported following accepted standards.
Reusability	Standard operating procedures are publicly available. Experiments are described in clear detail. Study and experiment metadata provide clear licensing requirements. Repository users can provide feedback and ask questions. Raw spectral data are available using an open file format.

API, application programming interface; HTTP, hypertext transfer protocol; MS, mass spectrometry; NMR, nuclear magnetic resonance; REST, representational state transfer.

transporters by the NP; and, if necessary based on the prior data, a clinical study of potential pharmacokinetic NPDIs in human subjects (Fig. 3).

The upper half of Figure 3 shows the cannabis studies conducted by the NaPDI Center as of March 2020. Chemical characterization data for two products were obtained from the National Center for Natural Products Research at the University of Mississippi. One product was an extract enriched in delta-9-tetrahydrocannabinol (THC) and the other was an extract enriched in cannabidiol (CBD). Purified THC and CBD were tested as inhibitors of five major cytochrome P450 (P450) enzymes, namely, CYP1A2, CYP2C9, CYP2C19, CYP2D6, and CYP3A4/5. Results informed the design of an ongoing clinical cannabis-drug interaction study.

The lower half of Figure 3 shows the kratom studies conducted by the NaPDI Center as of March 2020. The Analytical Core conducted a metabolomics study involving 55 kratom products, informing the selection of one product for further in vitro and clinical studies. The selection criteria followed a published NaPDI Center Recommended Approach (Kellogg et al., 2019). The Analytical Core conducted chemical characterization of the selected product to quantify mitragynine, 7-hydroxymitragynine, and speciofoline (Fig. 3). Extracts prepared from three kratom products, including one that was eventually selected for the clinical study, were tested by the Pharmacology Core as inhibitors of three major P450s, specifically CYP2C9, CYP2D6, and CYP3A4/5. As with cannabis, the in vitro results informed the design of the ongoing clinical kratom-drug interaction study.

Literature Search Process. Additional data were identified from peer-reviewed published reports in order for the data repository to provide greater research context for the NaPDI Center–conducted studies. Systematic literature searches were designed to retrieve studies on NP constituent pharmacokinetics and drug interactions involving either cannabis or kratom. The final search strategies are available in the Appendix. Queries were run in PubMed in July 2018 and again in February 2020.

The screening of titles and abstracts, and subsequently full text articles, was completed independently and in duplicate to identify experiments of the types shown in Figure 2. Mechanistic experiments of interest included assessing the NP as an inhibitor or inducer of P450s, UDP-glucuronosyltransferases (UGTs), and transporters. Clinical experiments of interest included pharmacokinetic NPDIs involving cannabis or kratom. Experiments involving only synthetic analogs, pharmacodynamics, or nonhuman animal studies and review articles were excluded. Full text articles available only in non-English languages were also excluded. Published reports cited in a recent review by the NaPDI Center (Cox et al., 2019) on cannabis pharmacology and pharmacokinetics ($n = 6$) were added to the screening results.

Data Entry of Published Literature and Pharmacokinetic NPDI Studies. Data from the included published reports were entered into the repository following the aforementioned SOPs (Boyce et al., 2020). When available, exact values from the text were entered. Otherwise, estimates were made from the study figures. Data extracted from each report were marked as "draft" during initial data entry and "pending" upon completion of data entry. After quality assurance by a second reviewer, the extracted data were made public. Data entry issues were tracked and addressed until quality assurance was complete for all studies.

Results

Construction and Content

As of April 2020, the NaPDI Center repository contains data from 777 experiments (Table 2). Currently, the most common experiment types are in vitro enzyme inhibition (405), in vitro enzyme induction (99), in vitro transport inhibition (78), and clinical pharmacokinetic NPDIs (57). The remaining 138 experiments are of various other types supported by the repository. In line with FAIR recommendations, every experiment is assigned a unique and persistent identifier that also resolves to a downloadable copy of a data set. A clear description of each experiment's conditions is provided by the repository website. The repository publishes metadata about each experiment that is machine readable and confirmed to work with Google's Dataset Search

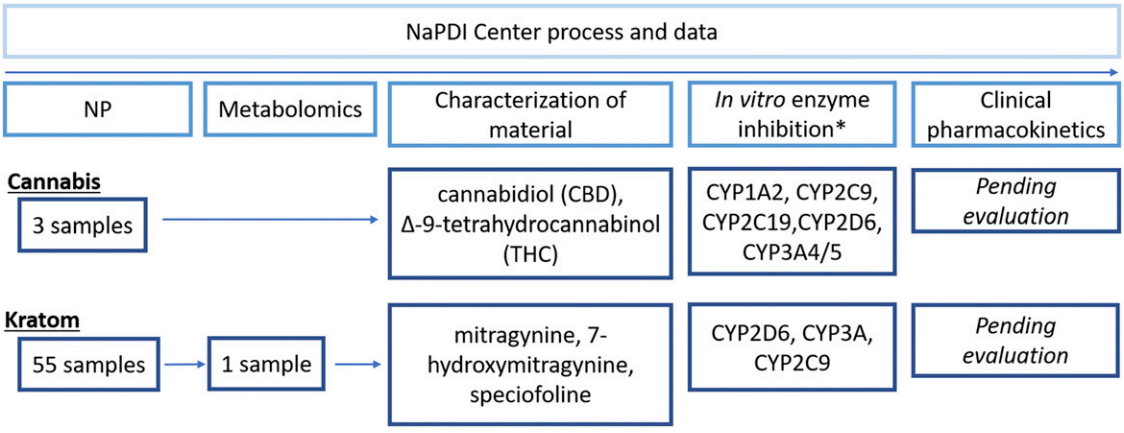

Fig. 3. Process and data undertaken by the NaPDI Center for the study of pharmacokinetic NPDIs precipitated by cannabis and kratom. *The Analytical Core did not source or characterize the cannabis study materials, whereas it conducted both investigations for kratom. The purified cannabis study materials were purchased from a commercial vendor.

TABLE 2

Number of experiments deposited in the NaPDI Center data repository as of April 2020 detailed for cannabis (*C. sativa*) and kratom (*M. speciosa*)

NaPDI Center repository (as of April 2020)	All high-priority NPs	Cannabis	Kratom
Chemical characterization experiments			
Characterization of NP study material	9	3	1
Metabolomics	3	0	1

Utility

This section reports the results of NaPDI Center repository data entry of the two high-priority NPs selected as case studies: cannabis (*C. sativa*) and kratom (*M. speciosa*).

Cannabinoids. Figure 4 provides an overview of reported NPDI data for cannabis from both NaPDI Center studies and peer-reviewed published reports. Links to the specific experiments are provided in Supplemental Table 2.

Chemical characterization data obtained from the National Center for Natural Products Research (https://pharmacy.olemiss.edu/ncnpr/) for two cannabis extracts and bulk plant material provided the exact concentration of CBD, THC, and other cannabinoids. The data confirmed the CBD-enriched extract (CBD 59.34%, THC 1.96%) to have a higher concentration of CBD than the bulk plant (CBD 0.04%, THC 11.7%) or THC-enriched extract (CBD 0%, THC 69.81%) (Fig. 4). NaPDI Center experiments confirmed that CBD inhibited CYP2C9, CYP3A4/5, CYP2C19, and CYP2D6 and that THC inhibited CYP2C9, CYP2C19, and CYP2D6 (unpublished data).

Data from a total of 22 published in vitro reports focusing on cannabis-drug interactions were entered into the repository (Holland et al., 2006, 2007, 2008; Zhu et al., 2006; Watanabe et al., 2007; Mazur et al., 2009; Alhamoruni et al., 2010; Tournier et al., 2010; Yamaori et al., 2010, 2011a,b, 2012, 2013, 2014, 2015; Jiang et al., 2011, 2013; Arnold et al., 2012; Al Saabi et al., 2013; Feinshtein et al., 2013a,b; Qian et al., 2019). As Figure 4 shows, experiments using either human liver microsomes or recombinant baculovirus–transfected insect cells expressing specific P450/UGT isoforms reported that cannabinoids inhibit CYP1A1, CYP1A2, CYP2C9, CYP2C19, CYP2D6, CYP3A4/5, and UGT (Mazur et al., 2009; Yamaori et al., 2010, 2011a,b, 2012, 2013; Al Saabi et al., 2013; Jiang et al., 2013; Qian et al., 2019). Yamaori et al. reported that CBD mechanistically inhibited CYP1A1 in vitro in recombinant baculovirus transfected insect cells. Qian et al. reported that CBD and cannabinol inhibited carboxylesterase 1 in vitro in human embryonic kidney 293 cells (Qian et al., 2019).

In vitro inhibition of P-glycoprotein–mediated efflux transport was reported for THC from experiments using transfected human embryonic kidney cells and for CBD using BeWo choriocarcinoma, LLC-PK1/MDR1, or MCF7/P-gp cells (Zhu et al., 2006; Tournier et al., 2010; Feinshtein et al., 2013a). An experiment using a human ovarian carcinoma cell line reported that cannabinol inhibited the efflux transporter multidrug resistance-associated protein 1 (MRP1 or ABCC1) (Holland et al., 2008). Experiments using BeWo, Jar, MCF7/P-gp, and MEF3.8/Bcrp A2 cell lines reported that CBD inhibited breast cancer resistance protein (BCRP or ABCG2), an effect that was reported for THC and cannabinol using the cell line MEF3.8/Bcrp A2 (Holland et al., 2008; Feinshtein et al., 2013b).

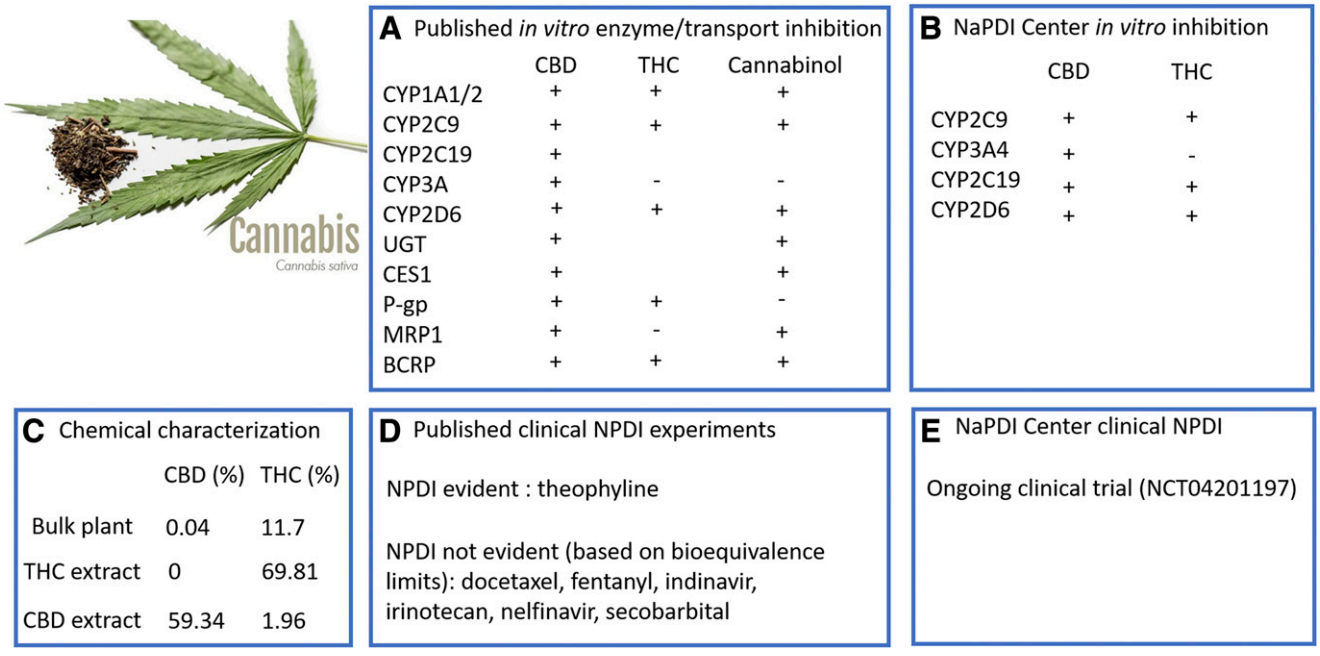

Fig. 4. Overview of reported NPDI data for cannabis from both NaPDI Center studies and peer-reviewed publications.

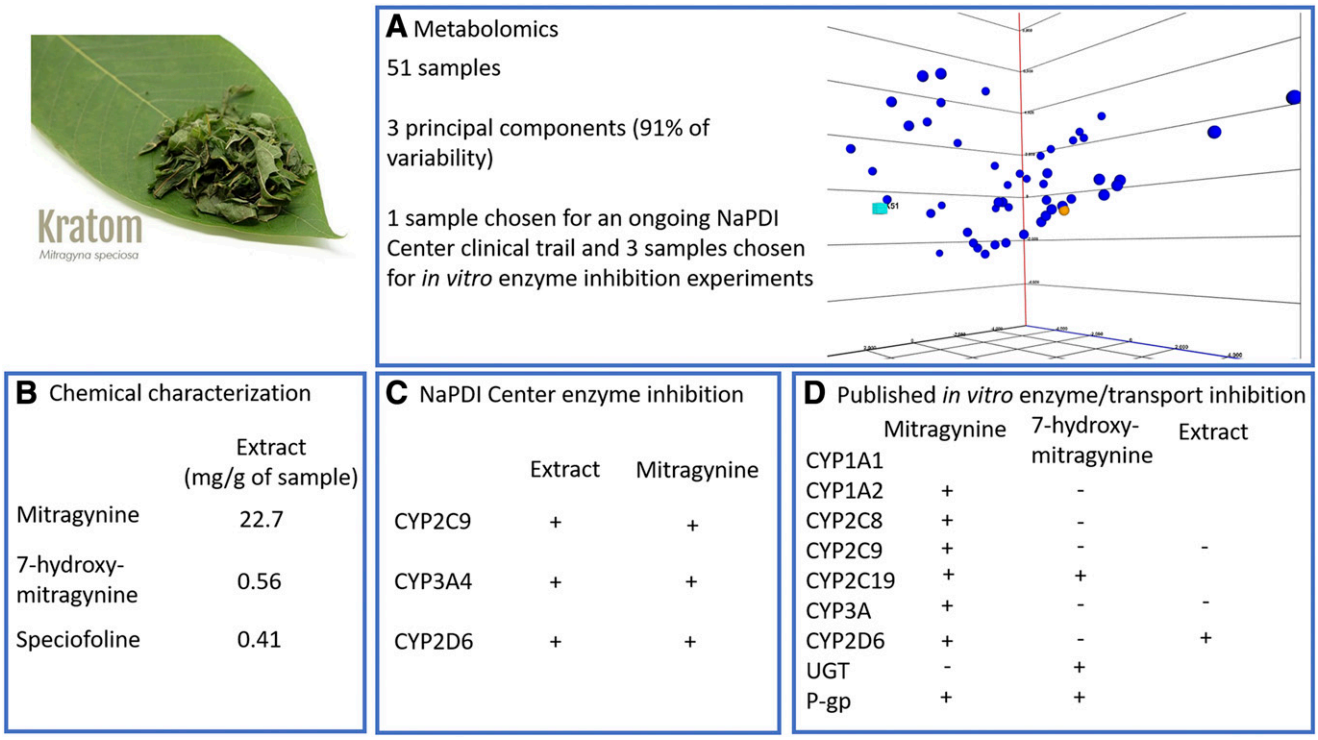

Fig. 5. Overview of reported NPDI data for kratom from both NaPDI Center studies and peer-reviewed publications. The results shown in boxes "b" and "c" are for the product chosen from the metabolomics study (light blue highlight in box "a").

A total of nine published clinical reports focusing on pharmacokinetic cannabis-drug interactions were entered into the repository (Dalton et al., 1976; Jusko et al., 1978; Perez-Reyes et al., 1988; Kosel et al., 2002; Haney et al., 2003; Engels et al., 2007; Kleinloog et al., 2012; Stott et al., 2013; Manini et al., 2015). Only one study reported an interaction involving smoked *C. sativa*, which was observed to increase the clearance of the CYP1A2 substrate theophylline (Jusko et al., 1978). Clinical pharmacokinetic interactions between cannabis and docetaxel, fentanyl, indinavir, irinotecan, nelfinavir, or secobarbital were not evident based on bioequivalence limits (Dalton et al., 1976; Kosel et al., 2002; Engels et al., 2007; Manini et al., 2015). One clinical study compared the plasma concentrations of THC and CBD under fasting and fed conditions (Stott et al., 2013), whereas another study reported estimated pharmacokinetic parameters for THC (Kleinloog et al., 2012).

Kratom. Figure 5 provides an overview of pharmacokinetic NPDI data for kratom from both NaPDI Center studies and peer-reviewed published reports. Links to the specific experiments are provided in Supplemental Table 3.

The Analytical Core's metabolomics analysis of 51 kratom products highlighted differences in chemical compound profiles depending on the manufacturer, form, and geographic location where the plants grew. A principal components analysis of the data identified three principal components explaining 91% of the variability across the features included in the metabolomics analysis.

Chemical characterization of the methanolic kratom extract used in the ongoing NaPDI in vitro and clinical studies (made from a clinical product) identified mitragynine (22.7 mg/g of sample), 7-hydroxymitragynine (0.57 mg/g of sample), and speciofoline (0.41 mg/g of sample). The in vitro inhibition studies showed that both the methanolic kratom extract and mitragynine inhibited CYP2C9, CYP2D6, and CYP3A4/5 by differing extents (unpublished observations).

Data from nine published in vitro studies were entered into the repository (Hanapi et al., 2010, 2013; Kong et al., 2011; Haron and Ismail, 2014; Manda et al., 2014; Meyer et al., 2015; Kamble et al., 2019, 2020; Rusli et al., 2019). One study using recombinant P450 enzymes reported that a methanolic extract of kratom inhibited CYP2D6 but not CYP2C9 or CYP3A4 (Hanapi et al., 2010). One study using pooled human liver microsomes reported inhibition of CYP2C19 by 7-hydroxymitragynine (Kamble et al., 2020), whereas another study using recombinant enzymes reported inhibition of UGT1A1 by 7-hydroxymitragynine (Haron and Ismail, 2014).

Mitragynine inhibition of CYP2D6 was reported in three different studies using pooled human liver microsomes (Kamble et al., 2020), recombinant P450s (Hanapi et al., 2013), and a high-throughput in vitro fluorescent P450 assay (Kong et al., 2011). Mitragynine inhibition of CYP3A and CYP2C19 was reported with pooled human liver microsomes (Kamble et al., 2020) and the in vitro fluorescent P450 assay (Kong et al., 2011). Mitragynine inhibition of CYP2C8 was reported with pooled human liver microsomes (Kamble et al., 2020), CYP1A2 with an in vitro fluorescent P450 assay (Kong et al., 2011), and CYP2C9 with recombinant P450 enzymes (Hanapi et al., 2013).

Three studies reported inhibition of P-glycoprotein by mitragynine, two using Caco-2 cells (Meyer et al., 2015; Rusli et al., 2019), and one using MDCK-transfected cells (Manda et al., 2014). The same MDCK-transfected cell study reported inhibition of P-glycoprotein by 7-hydroxymitragynine. One study reported CYP3A4 as the primary metabolizing enzyme for mitragynine (Kamble et al., 2019). Another study reported downregulation of P-glycoprotein in Caco-2 cells by mitragynine (Rusli et al., 2019).

Discussion

Although rigorous pharmacokinetic NPDI research can mitigate adverse interactions, the data and knowledge resulting from these experiments are currently distributed across a variety of information sources, making them difficult to find, access, and reuse. The new

NaPDI Center repository is the first user-friendly online repository that stores and links pharmacokinetic NPDI data across chemical characterization, metabolomics analyses, and pharmacokinetic in vitro and clinical experiments. The design is expected to help researchers more easily arrive at a complete understanding of pharmacokinetic NPDI research on a particular NP. The repository will also facilitate multidisciplinary collaborations, as the repository links all of the experimental data for a given NP across the study types. For example, the repository links chemical characterization data with data from in vitro and clinical experiments and vice versa. This feature should help facilitate communication between multidisciplinary researchers working on different aspects of a particular pharmacokinetic NPDI.

The mission of the NaPDI Center is to provide leadership and guidance on the study of pharmacokinetic NPDIs. Currently, only data on the four high-priority NPs under study by the NaPDI Center have been entered in the repository. Future work hopes to expand the repository to include a larger selection of NPs and engage NPDI researchers external to the NaPDI Center. Toward that goal, pilot work is completed that includes data from experiments involving P450 inhibition by three licorice species (i.e., *Glycyrrhiza glabra*, *G. uralensis*, and *G. inflata*) (Li et al., 2017). The published report includes pharmacokinetic NPDI data specific to extracts of each licorice species and for individual constituents present in some or all licorice species. The repository links all of these data in a manner that allows researchers to explore P450 inhibition by licorice from a variety of perspectives (i.e., single or multiple licorice species and single or multiple licorice constituents). It is useful to emphasize that the NaPDI Center repository currently focuses on pharmacokinetic NPDI data. At the present time there are no plans to integrate pharmacodynamic NPDI data. Though it has not been the focus to date, the format for data in the NaPDI data repository allows for setting the NP as the object drug, and there are a handful of experiments in the repository of this kind that have been entered as test cases. The inclusion of this kind of data might become the focus in the future depending on feedback from the NPDI research community and other stakeholders.

Building upon this strong foundation, the NaPDI Center plans to create novel information visualizations to provide researchers a complete evidence-based overview of the potential of each NP to precipitate pharmacokinetic NPDIs. The Center also plans to permit other researchers to submit data using files or the repository's web-based application programming interface with the goal of supporting medium- to high-throughput assays that generate megabytes or gigabytes of data. Researchers external to the NaPDI Center can enter data by first requesting an account and then following the SOP documents during data entry. After a researcher's data entry is completed, a trained individual within the NaPDI Center will inspect the entered data before public release.

Finally, the NaPDI Center plans to implement automatic FAIR quality analytic reports that will run each time a data submitter marks a new study entry as "pending." Issues identified from the reports can then be addressed promptly by the data submitter. These functionalities, combined with the existing functionalities of the NaPDI Center repository, seek to facilitate pharmacokinetic NPDI research with the long-range goal of mitigating adverse interactions and improving public health.

Acknowledgments

The authors would like to thank the University of Washington's Drug Interaction Solutions team, specifically Isabelle Ragueneau-Majlessi, Jessica Sontheimer, Jinjing Yu, and Chris Kinsella for the early design and implementation of the repository. The authors also thank University of Pittsburgh analysts Yifan Ning and Max Sibilla for their contribution to advancing the design and adding features.

Authorship Contributions

Participated in repository design: Birer-Williams, Gufford, Chou, McCune, Paine, Boyce.

Contributed to literature searches: Birer-Williams, Gufford, Chou, Alilio, VanAlstine, Morley, Boyce.

Conducted data entry: Birer-Williams, Chou, Alilio, VanAlstine, Morley, Boyce.

Wrote or contributed to the writing of the manuscript: Birer-Williams, Gufford, Alilio, VanAlstine, Morley, McCune, Paine, Boyce.

Appendix: Search Strategy for Cannabis

Clinical Studies

(Clinical Trial [PT] AND (Cannabis[MeSH Terms] OR "cannabinoids"[All Fields] OR "Cannabidiol"[All Fields] OR "CBD"[All Fields] OR "Cannabinol"[All Fields] OR "Dronabinol"[All Fields] OR "delta(9)-THC"[All Fields] OR "9-ene-Tetrahydrocannabinol"[All Fields] OR "9 ene Tetrahydrocannabinol"[All Fields] OR "THC"[All Fields] OR "delta(1)-Tetrahydrocannabinol"[All Fields] OR "delta(1)-THC"[All Fields] OR "delta(9)-Tetrahydrocannabinol"[All Fields] OR "Tetrahydrocannabinol"[All Fields] OR "Tetrahydrocannabinol, (6a-trans)-Isomer"[All Fields] OR "Tetrahydrocannabinol, Trans-Isomer"[-All Fields] OR "Tetrahydrocannabinol, Trans Isomer"[All Fields] OR "Tetrahydrocannabinol, (6aS-cis)-Isomer"[All Fields] OR "Tetrahydrocannabinol, Trans-(+-)-Isomer"[All Fields] OR "Marinol"[All Fields] OR "Tetrahydrocannabinol, (6aR-cis)-Isomer"[All Fields] OR "delta-9-tetrahydrocannabinol"[All Fields] OR "(-)delta-9-tetrahydrocannabinol"[All Fields] OR "THC"[All Fields]) AND "drug interactions"[All Fields]) NOT Review [PT].

Mechanistic NPDI studies useful for inferring NPDIs:

Step 1) Log into My NCBI and go to Pubmed: https://www.ncbi.nlm.nih.gov/pubmed/.

Step 2) In the advanced search form, clear the search history.

Step 3) Paste in this query into builder (using "edit") and click "add to history"—this step is referred to as "#1" in the rest of this search strategy:

"Cytochrome P-450 Enzyme System"[MeSH Terms] OR "Cytochrome P450 Family 1"[MeSH Terms] OR "Cytochrome P450 Family 2"[MeSH Terms] OR "Cytochrome P450 Family 3"[MeSH Terms] OR CYP1A1[All Fields] OR CYP1A2[All Fields] OR CYP1A3[All Fields] OR CYP1A4[All Fields] OR CYP1A5[All Fields] OR CYP2D6[All Fields] OR CYP2C9[All Fields] OR CYP2A6[All Fields] OR CYP2C8 [All Fields] OR CYP2C19[All Fields] OR CYP2B6[All Fields] OR CYP2B1[All Fields] OR CYP2E1[All Fields] OR CYP3A4[All Fields] OR CYP3A5[All Fields] OR UGT1[All Fields] OR UGT1A1[All Fields] OR UGT1A3[All Fields] OR UGT1A4[All Fields] OR UGT1A5[All Fields] OR UGT1A6[All Fields] OR UGT1A7[All Fields] OR UGT1A8[All Fields] OR UGT1A9[All Fields] OR UGT1A10[All Fields] OR UGT2[All Fields] OR UGT2A1[All Fields] OR UGT2A2 [All Fields] OR UGT2A3[All Fields] OR UGT2B4[All Fields] OR UGT2B7[All Fields] OR UGT2B10[All Fields] OR UGT2B11[All Fields] OR UGT2B15[All Fields] OR UGT2B17[All Fields] OR UGT2B28[All Fields] OR B3GAT1[All Fields] OR B3GAT2[All Fields] OR B3GAT3[All Fields].

Step 4) Paste in this query into builder (using "edit") and click "add to history"—this is referred to as "#2" in the rest of this search strategy.

"Solute Carrier Proteins"[MeSH Terms] OR "Membrane Transport Proteins"[MeSH Terms] OR "P-gp"[All Fields] OR "p-glycoprotein"[All Fields] OR BCRP[All Fields] OR OCT2[All Fields] OR

"Organic Cation Transporter 2"[MeSH Terms] OR "Organic Cation Transport Proteins"[MeSH Terms] OR MATE1[All Fields] OR "SLC4A Proteins"[MeSH Terms] OR MATE-2K[All Fields] OR "SLC4A Proteins"[MeSH Terms] OR OATP[All Fields] OR OAT1 [All Fields] OR "Organic Anion Transport Protein 1"[MeSH Terms] OR OAT3[All Fields] OR UGT1[All Fields] OR "Glucuronosyltransferase"[MeSH Terms] OR ABC[All Fields] OR "ATP-Binding Cassette Transporters"[MeSH Terms]

Step 5) Paste in this query into builder (using "edit") and click "add to history"—this step is referred to as "#3" in the rest of this search strategy.

(Cannabis[MeSH Terms] OR "cannabinoids"[All Fields] OR "Cannabidiol"[All Fields] OR "CBD"[All Fields] OR "Cannabinol"[All Fields] OR "Dronabinol"[All Fields] OR "delta(9)-THC"[All Fields] OR "9-ene-Tetrahydrocannabinol"[All Fields] OR "9 ene Tetrahydrocannabinol"[All Fields] OR "THC"[All Fields] OR "delta(1)-Tetrahydrocannabinol"[All Fields] OR "delta(1)-THC"[All Fields] OR "delta(9)-Tetrahydrocannabinol"[All Fields] OR "Tetrahydrocannabinol"[All Fields] OR "Tetrahydrocannabinol, (6a-trans)-Isomer"[All Fields] OR "Tetrahydrocannabinol, Trans-Isomer"[All Fields] OR "Tetrahydrocannabinol, Trans Isomer"[All Fields] OR "Tetrahydrocannabinol, (6aS-cis)-Isomer"[All Fields] OR "Tetrahydrocannabinol, Trans-(+-)-Isomer"[All Fields] OR "Marinol"[All Fields] OR "Tetrahydrocannabinol, (6aR-cis)-Isomer"[All Fields] OR "delta-9-tetrahydrocannabinol"[All Fields] OR "(-)delta-9-tetrahydrocannabinol"[All Fields] OR "THC"[All Fields]).

Step 6) Paste in this query into builder (using "edit") and click "add to history"—this is referred to as "#4" in the rest of this search strategy.

NaPDI Repository Data Entry SOP: In vitro Enzyme Inhibition Studies

Version 1

Creation Date: March 2017

Author: Jessica Tay-Sontheimer

NOTE: This version is provided as supplemental information for a manuscript. Please check the github repository for this project as any more recent version on github supercedes this version:

https://github.com/dbmi-pitt/NaPDI-SOPs

Contents

1 BACKGROUND

1.1 SCOPE

The purpose of this Standard Operating Procedure (SOP) is to describe how to enter *in vitro* enzyme inhibition results into the NaPDI repository. Natural Products (NPs) are expected to be evaluated as causative agents of inhibition (*Precipitants*). The victim drugs (*Objects*) are probe substrates of known enzymes.

Most of the information entered in the repository will come directly from the study report; avoid interpretations of the authors' conclusions. However, several text fields are provided throughout the admin site to allow the addition of relevant comments that may pertain to the experimental study design and conditions, the study results, and/or the mechanism of inhibition. This additional information should be reviewed with the principal investigators during the validation process as it will be used to enrich the users experience and understanding of the results.

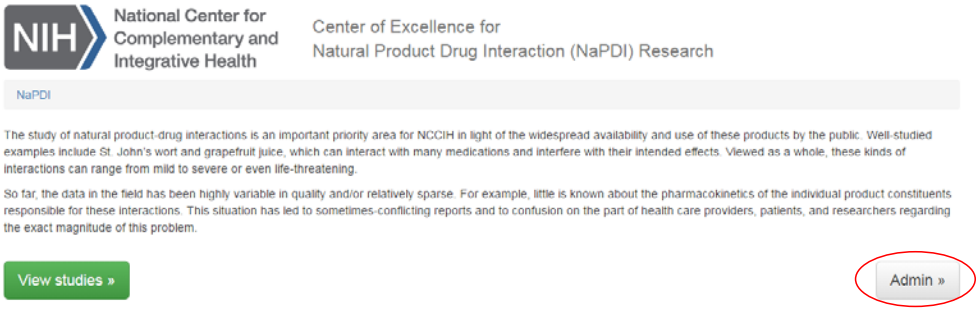
1.2 DEFINITIONS

Add user-centered definitions (alphabetically)

2 CREATING A STUDY

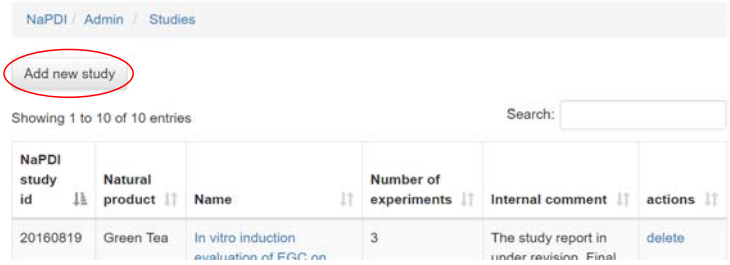
Use the following steps to create a new study.

2.1 Navigate to the Admin page of the NaPDI Repository



2.2 Using the admin page, click on "Studies"

2.3 then, click on “Add new study”



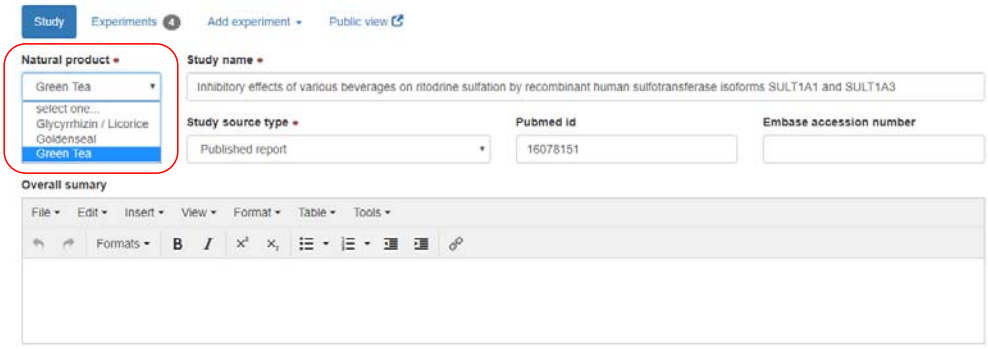
3 STUDY PAGE

A study can only accept data from one Natural Product and one species. For example, *in vitro* data with Licorice *Glycyrrhiza glabra* L., *Glycyrrhiza uralensis* Fish have to be reported in two different studies, one for each Licorice species.

3.1 Select the **Natural Product** tested in the *in vitro* study from the drop down list provided (select one; required):

- Licorice
- Goldenseal
- Green Tea

3.2 From the Study Report, enter the **Study Name** and **NaPDI Study ID** (required, as presented in Study Report).



If a entries originate from a published paper, used the Pubmed ID or Embase PUI as the NaPDI Study ID (e.g., "PMID:23268924")

3.3 Select the **study source type** or source from which the study was obtained (required).

- Published report
- Manuscript prepared or submitted for peer-reviewed publication
- Unpublished data submitted through a NaPDI form

3.4 When a study has been published, enter the **PubMed ID** and/or **Embase Accession** number(s) (optional).

Tip: If the PubMed ID or Embase Accession number(s) cannot be located in the Study Report, they can be found under the abstract in PubMed or in the "Additional Information" section when the article's full record is viewed in Embase.

Effects of green tea extracts on the pharmacokinetics of quetiapine in rats.

Ezzeldin E[1], Asiri YA[2], Iqbal M[1].

Author information

Abstract

Quetiapine is an atypical antipsychotic, used clinically in the treatment of schizophrenia, acute mania in bipolar disorders, and bipolar depression in adults. In this study, the effect of green tea extracts (GTE) on the pharmacokinetics of quetiapine (substrate of CYP3A4) was investigated in rats. Male Wistar albino rats received GTE (175 mg/kg) or saline (control) by oral gavage for 7 days before a single intragastric administration of 25 mg/kg quetiapine. Plasma concentrations of quetiapine were measured up to 12 h after its administration by a validated ultraperformance liquid chromatography-tandem mass spectroscopy. Pretreatment with GTE produced significant reductions in the maximum plasma concentration and area under the curve of quetiapine by 45% and 35%, respectively, compared to quetiapine alone. However, GTE did not produce significant change in elimination half-life and oral clearance of quetiapine. This study concluded that GTE may decrease the bioavailability of quetiapine when coadministered.

Additional Information

Embase identification number (PUI)	L610726960
Abbreviated Journal Title	J. Pharm. Pharm. Sci.
ISSN	14821826 (electronic)
CODEN	JPPSF
Source Type	Journal
Source Publication Date	2016-05-26
Entry Date	2016-06-23 (Full record), 2016-06-20 (Article in Press/In process)
Publication Type	Article
Page Range	188-197
Country of Author	Japan
Country of Source	Canada
Language of Article	English
Language of Summary	English
Embase Accession Number	20160446749
Number of References	35
Cited by in Scopus	
Drug Manufacturers	Nakarai (Japan), Wako (Japan)

3.4 **Overall summary**: this summary should provide a concise overall conclusion of the *in vitro* study and also discuss the possible mechanism(s) involved (optional).

Comment [RDB1]: How many words? Studies can consist of numerous experiments. Please provide some example statements so that the scope of this comment field is more clear.

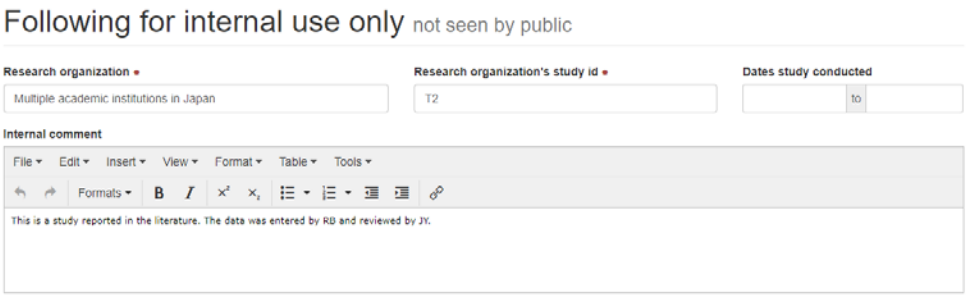
If entries are from a published paper, copy and paste the abstract into the Overall summary box.

3.5 The **Following for internal use only** section is designated for internal notes and will not be displayed to users.

3.5.1 Enter the **Research organization** name (where the study was performed) and their **study ID number** in the internal use section displayed below (required).

3.5.2 From the Study Report, enter the **dates the study was conducted** (optional). If only months are provided, select the first and last days of the month for the starting and ending date, respectively. For example, March to April, 2017 will be entered as 03/01/2017 to 04/30/2017.

3.5.3 Enter **internal comments** associated with the study that are intended for internal use only (optional).



3.6 Select the status of the current study entry

- Draft – selected when the curator is in the process of entering the data or checking the data
- Pending review – selected when the study had been fully entered by the curator and needs to be reviewed and validated by a second editor
- Published – selected after validation and is ready for public display

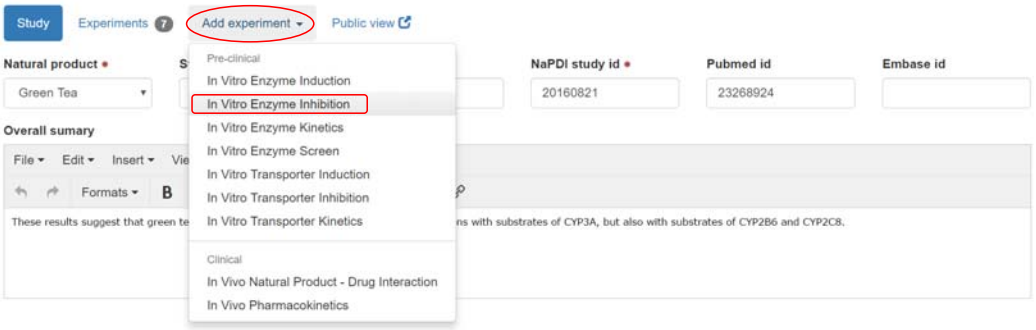
Comment [JS2]: Tell chris that a non-unique ID triggers an error.

Comment [RDB3]: Please refer to a specific reference that these ids will come from.

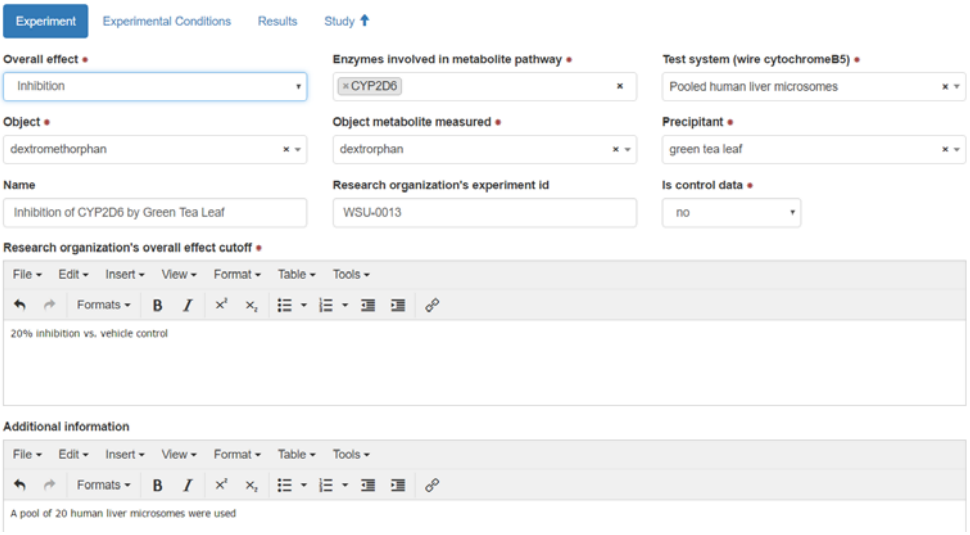
4 EXPERIMENT

After a study has been created, use the following steps to add a new experiment. Add a new experiment for determinations of parameters having a distinct set of experimental conditions from previous experiments (i.e., different object concentrations, different inhibitor concentrations, etc.).

4.1 Click on **add experiment**, then select **In Vitro Enzyme Inhibition** from the drop-down menu.



4.2 Select the **Overall effect**: "Inhibition", or "Negligible Inhibition" of the metabolism of the *Object,* based on study findings stated in the Study Report (select one; required). Use the authors' conclusions to make this determination. For example, if inhibition was observed, but the authors concluded no effect because it was not statistically significant, then "Negligible Inhibition" should be selected. Conversely, if 19% inhibition was observed with a 20% cut-off and the authors concluded weak inhibition, then "Inhibition" should be selected.



4.3 Select the **Enzyme(s) involved in the metabolite pathway** as stated in the Study Report (select many; required). Multiple selections can be made; therefore, select all enzymes responsible for the formation of the metabolite (if specific formation of metabolite is measured) or parent disappearance (if parent disappearance is measured).

Notes:

(1) When an enzyme studied is not listed in the drop-down menu, add the enzyme or state the enzyme in the **Additional information** section (see below).

(2) When variant enzymes are studied, select the variant enzyme and specify the variant in the **Additional information** text box (see below).

4.4 Select the *in vitro* **test system** used (select one; required).

Notes:

(1) For **recombinant expression systems** only, appropriately select **Cytochrome b5** conditions.

Choose:

- "Yes, co-expressed" if Cytochrome b5 was used and co-expressed in the recombinant system
- "Yes, supplemented" if Cytochrome b5 was used and was added to the incubation
- "No" if Cytochrome b5 was not used
- "Not available" if conditions regarding Cytochrome b5 are not provided in the Study Report

(2) If a study used a few donors of human liver microsomes, but each donor was evaluated individually, and results were presented as the mean value from all the donors, select

"pooled" source and add a comment stating that experiments were conducted in HLMs from individual donors in the **Additional information** section.

4.5 Select the **Object** and **Object metabolite** measured from the compound lists (select one; required). If the compound is not listed, add the compound. Enter only the study vehicle control (i.e. not the positive or negative control) as the object. Enter the details regarding the positive/negative control in the Additional Information section under this tab.

4.6 Select the **Precipitant** from the compound list (select one; required). If the compound is not listed, add the compound.

4.7 Enter an experiment **Name**, if provided (optional). Use title case, where the first word and all major words are capitalized (i.e., "Inhibition of CYP2D6 by Green Tea Leaf", NOT "Inhibition of CYP2D6 by green tea leaf".) Experiment names are used as sub-headings in the public view; therefore, names that describe the enzyme(s) involved in the pathway of the metabolite and the precipitant used in the study are best suited for this purpose.

4.8 If provided, enter the **research organization's experiment identification number** for this experiment only (optional).

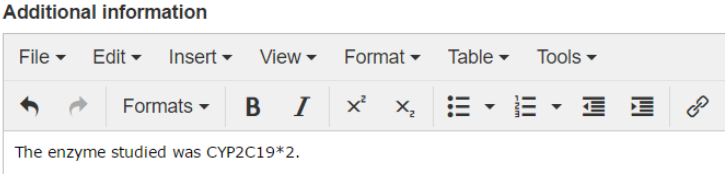
4.9 If this data corresponds to the control experiment for the study, choose "yes" from the **Is control data** drop-down menu (select one; required). Otherwise, choose "no". The "Is control data" function allows experiments to be linked within the repository. It only appears on the admin side and not in the public view.

4.10 Enter the **Research organization's overall effect cutoff** (required) described in the Study Report (for example, "20% inhibition versus control"). Enter multiple cut-offs if more than one is provided in the Study Report. If the authors did not provide this, attempts should be made to obtain this information. Enter "not applicable" when the cut-off is not applicable.
For published reports, enter "not available" or "N/A" when this information is not available or not applicable.

4.11 Enter **Additional information** important to the overall study, but where the details were not included in the fields above (optional). Enter only the study vehicle control (i.e. not the positive or negative control) as the object. Enter the details regarding the positive/negative control in the Additional Information section under this tab.

For example:

- variant enzymes, other enzymes or test systems not listed in the drop-down menu



- variations on the precipitant selected

Goldenseal flower bud methanol extract was used.

- results of other experiments used to determine the enzyme(s) involved in the formation of the metabolite

The enzymes responsible for the formation of the metabolite were identified through phenotyping studies.

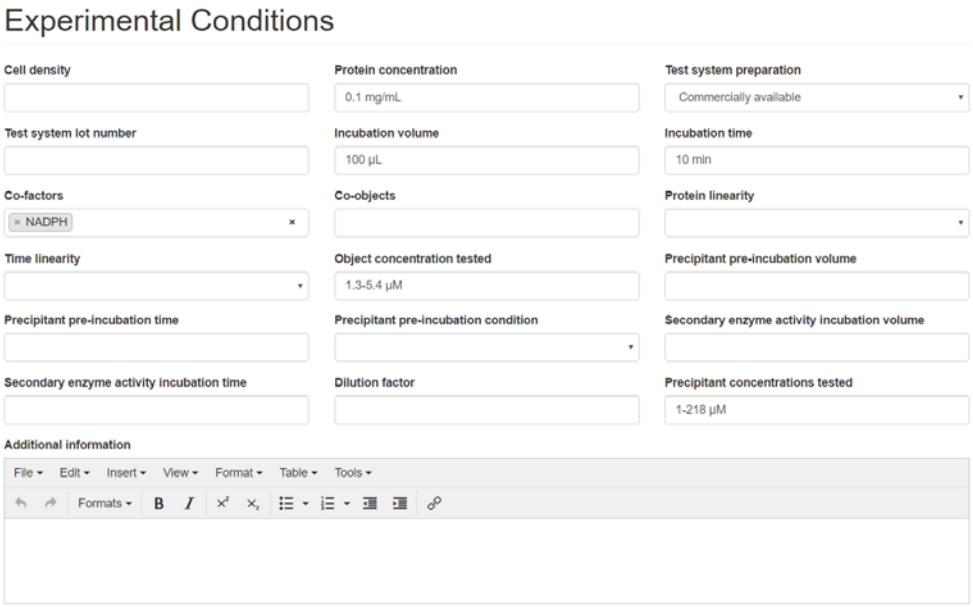
Comment [RDB4]: It will be REALLY helpful if folks can save as they complete each section, or just anytime at all. In fact, these days, people are used to data being saved as they type it in. Rather than 'submit' or 'save; one could 'validate' or 'finalize submission' or similar.

5 EXPERIMENTAL CONDITIONS

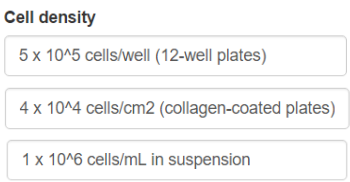
Enter experimental details that are provided in the Study Report.

Note that in many cases, some of the provided fields may be left blank.

> When entering conditions from published literature that refer to experimental conditions described in a reference, check the reference for conditions that are not clearly stated in the article. For example, if an article states that CYP1A2 substrates and concentrations used in Vivid CYP screening assays were used as described in Cheng et al. and the authors do not describe any further details, check Cheng et al. for experimental conditions and enter those stated therein. Also, make a comment in the additional information section regarding which parameters were extracted from the reference citation (*e.g.*, Object and object concentrations tested were extracted from Cheng et al., 2017).



5.1 Cell density: Enter the cell density in scientific notation. Specify the units and the type of culture plates or dishes used (optional). Examples are shown below:



5.2 **Protein concentration:** Enter the total protein concentration and specify the units as they are presented in the Study Report (optional). If a protein amount and volume used are provided, calculate the concentration by dividing the amount by the volume (*e.g.*, 0.1 mg/0.5 mL = 0.2 mg/mL).

Comment [RDB5]: Is this conversion required?

Protein concentration

0.2 mg/mL

5.3 **Test system preparation:** Select one of the following from the drop-down menu (select one; optional):

- **In-house preparation** – select this when the *in vitro* test system used was prepared in house
- **Commercially available** – select this when the *in vitro* test system used originally provided by a commercial vendor

5.4 **Test system lot number**: If provided, enter the test system lot number for those that were provided by a commercial vendor (optional).

Test system lot number

06103045

5.5 **Incubation volume**: Enter the total volume used in the incubation, specify the units as they are presented in the Study Report (optional). If volumes were listed in steps, the total incubation volume may be calculated by adding the volumes used in each step (*e.g.*, 100 µL buffer + 10 µL NADPH + 40 µL compound tested + 50 µL precipitant used = 200 µL total volume).

Incubation volume

200 µL

5.6 **Incubation time**: Enter the duration of the incubation, specify the units as they are presented in the Study Report (optional). This duration implies the presence of all necessary components of the incubation (*i.e.*, the enzyme, the object, the precipitant, and if used, co-factors). Specify pH for experiments using conditions other than pH 7.4

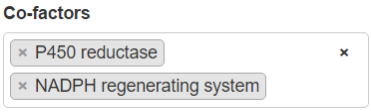
Incubation time

5 min

6 Incubation time

30 min at pH 6.8

5.7 **Co-factors**: Select co-factors used in the incubation from the drop-down list provided. Multiple co-factors may be selected as needed (select many; optional).



5.8 **Co-substrates**: Select co-substrates used to study enzyme activity from the drop-down list provided (select many; optional).

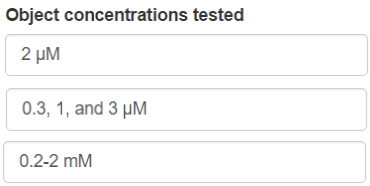
5.9 **Protein linearity**: Select one of the following from the drop-down menu (select one; optional):

- **Available** – select this when the linearity of product formation or substrate depletion with protein concentration is tested
- **Not available** - select this when no indication of testing linearity of product formation or substrate depletion with protein concentration is provided

5.10 **Time linearity**: Select one of the following from the drop-down menu (select one; optional):

- **Available** – select this when the linearity of product formation or substrate depletion with incubation time is tested
- **Not available** - select this when no indication of testing linearity of product formation or substrate depletion with incubation time is provided

5.11 **Object concentrations tested**: Enter the object concentration(s) used in the incubation, specify the units as they are presented in the Study Report (optional). Enter only the study vehicle control (i.e. not the positive or negative control) as the object. Enter the details regarding the positive/negative control in the Additional Information section under this tab. A single concentration, multiple concentrations or a range of concentrations may be entered, see below for examples. If possible, avoid entering "0" as a starting concentration, but rather, use the lowest concentration provided as the starting concentration (*i.e.*, do not enter 0-2 mM, but rather enter 0.2-2 mM).



5.12 **Precipitant concentrations tested:** Enter the precipitant concentration(s) used in the incubation, specify the units as they are presented in the Study Report (optional). A single concentration, multiple concentrations or a range of concentrations may be entered.

Precipitant concentrations tested

5 nM

2, 10, and 50 µM

1-10 µM

****

The following fields are to be used for mechanism-based or time-dependent inhibition studies only:

5.13 Precipitant pre-incubation volume (optional): Enter the total volume used for the primary incubation (inactivation of the enzyme), specify the units as they are presented in the Study Report (*e.g.*, 100 µL).

5.14 Precipitant pre-incubation time (optional)**:** Enter the duration used for the primary incubation (inactivation of the enzyme), specify the units as they are presented in the Study Report (*e.g.*, 10 min).

5.15 Precipitant pre-incubation condition (select one; optional)**:**

- **NADPH with precipitant** – select this when both NADPH and the precipitant are present in the primary incubation (inactivation of the enzyme)
- **NADPH with no precipitant** – select this when NADPH but not the precipitant is present in the primary incubation (inactivation of the enzyme)
- **No NADPH with precipitant** – select this when the precipitant but not NADPH is present in the primary incubation (inactivation of the enzyme)
- **No NADPH with no precipitant** – select this when neither NADPH nor the precipitant is present in the primary incubation (inactivation of the enzyme)

5.16 Secondary enzyme activity incubation volume (optional)**:** Enter the total volume used for the secondary incubation (measurement of enzyme activity), specify the units as they are presented in the Study Report (*e.g.*, 200 µL).

5.17 Secondary enzyme activity incubation time (optional)**:** Enter the duration used for the secondary incubation (measurement of enzyme activity), specify the units as they are presented in the Study Report (*e.g.*, 30 min).

5.18 Dilution factor (optional)**:** Enter the dilution factor used going from the primary to the secondary incubation (*e.g.*, 1:10).

****

5.19 Additional information (optional)**:** As needed, add any other information that is important to the experimental conditions, but that were not detailed in the fields above. If reporting a vehicle control, enter the details regarding the positive/negative control in this section. In the public view, this section will appear before any of the other experimental details entered.

Examples of additional information might include issues limiting the experimental design (*e.g.*, solubility), deviations from physiological pH (*e.g.*, studies were conducted at pH 6.0), details regarding substrate cocktail assays, etc.

Additional information

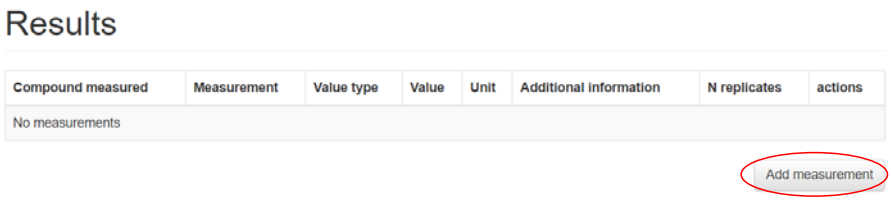
Formats

Due to solubility issues, the highest tested concentration of green tea leaf was 218 µg/mL.

6 RESULTS

6.1 Use the **Add measurement** function to add a new measurement to the table of results.



The object compound (or metabolite) name selected in the experiment page will automatically be populated in the **Compound measured** field.

6.2 Select a **Measurement type** (select one; required) from the drop-down list, the associated **Unit** (select one; required) and the **Value Type** (select one; required) based on the available data in the Study Report. Use separate entries for each type of measurement. Available measurement types include:

Measurement type	Selection criteria
% Inhibition$_{pre\text{-}incubation}$	The percent inhibition is reported during the pre-incubation phase of a mechanism-based or time-dependent inhibition assay.
% Inhibition$_{co\text{-}incubation}$	The percent inhibition is reported during the co-incubation phase of a mechanism-based or time-dependent inhibition assay.
% Inhibition	Percent inhibition is reported.
Ki total	Ki corresponding to the total (bound and unbound) precipitant is reported. For published literature: If apparent Ki is reported without information regarding protein binding, select Ki total and make a note in the additional information section.
Ki unbound	Ki corresponding to the unbound precipitant is reported.
$IC_{50\ pre\text{-}incubation}$	The IC_{50} value reported during the pre-incubation phase of a mechanism-based or time-dependent inhibition assay.
$IC_{50\ co\text{-}incubation}$	The IC_{50} value reported during the co-incubation phase of a mechanism-based or time-dependent inhibition assay.
IC_{50}	IC_{50} value is reported.
IC_{50} fold-shift	The IC_{50} fold-shift (fold-change) is reported.
K_{inact}	For mechanism-based or time-dependent inhibition, the K_{inact} is reported.

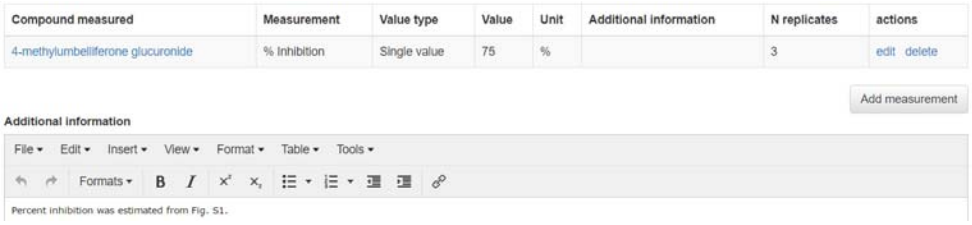
K_I	For mechanism-based or time-dependent inhibition, the K_I is reported.
K_{inact}/K_I	For mechanism-based or time-dependent inhibition, the K_{inact}/K_I is reported or this value can be calculated from the K_{inact} and K_I values provided.

According to the selections, appropriate fields will appear, including the following:

6.2.1 **Value** (select one; required) – based on the Study Report choose mean, median, or single value (mean or median is not specified) for the parameter to be entered. Before the value field, select ">", "≥", "<", or "≤" when provided in the Study Report; "=" is the default if no selection is made.

Comment [JS6]: Chris has not yet implemented this

For data from published articles: If the **percent inhibition** value is not explicitly stated in the article it can often be estimated from presented figures. Estimate the percent inhibition and in the additional information box located directly below the results, state that the value entered was estimated and specify the information source.



6.2.2 **Variability** (required) – enter the standard error of the mean (**SEM**), percent coefficient of variation (**%CV**), standard deviation (**SD**), 90% or 95% confidence interval (**90% CI**, **95% CI**) or **range** associated with the value.

6.2.3 Enter the total number of **(N) replicates** (required) used in the study (e.g., enter 1 when only one test was conducted, 3 when a total of 3 replicates were used, etc.).

Comment [JS7]: Ask chris to add a range as an input option for N replicates and to make this field optional as this is not always provided in published literature

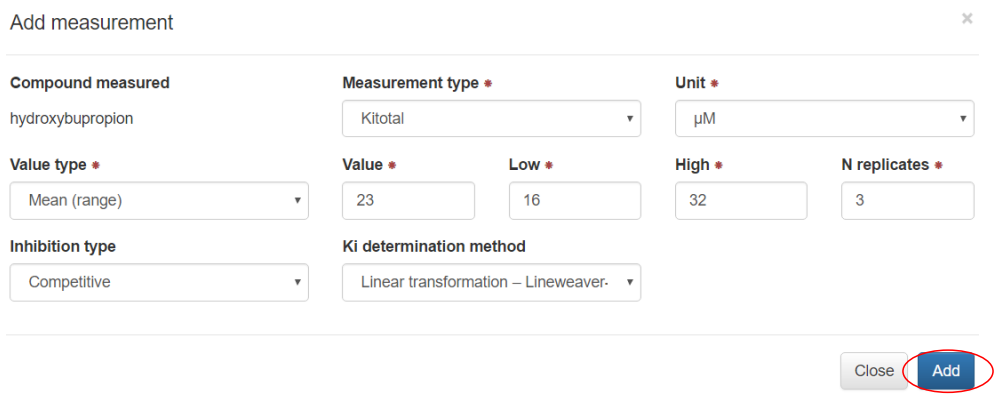
6.2.4 When statistical tests are conducted, select a significance level of the **P value** tested or **not significant** (optional) when the null hypothesis is true. If the authors give a P value that is not available in the drop-down menu, chose the level of significance that is true (e.g., if P = 0.0009 in the Study report, choose P < 0.001).

6.2.5 **Ki determination**: according to the Study Report, select the method used to determine Ki from the following options:

- Nonlinear least-squares regression
- Linear transformation – Eadie-Hofstee plot

- Linear transformation – Lineweaver-Burk plot
- Linear transformation – Dixon plot
- Graphic Read
- Not Available

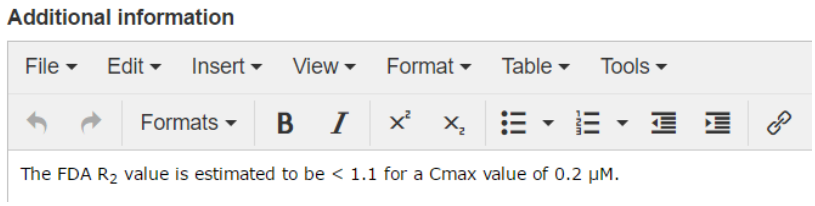
6.3 When all PK measurements have been entered for that entry, click **Add**.

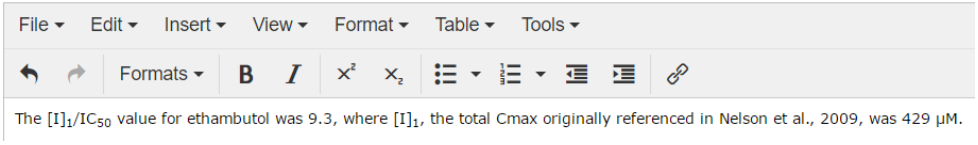


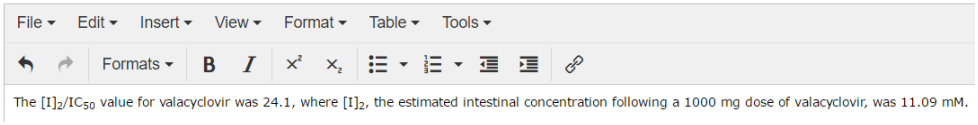
6.4 **Additional Information:** as needed, add any other information that is important to the result, but that were not detailed in the results table. If reporting a vehicle control, enter the details regarding the positive/negative control in this section.

For example,

In vivo DDI predictions ($[I]/IC_{50}$ or $[I]/K_i$ ratios, R_2 values, etc.) provided in the Study Report. Indicate the C_{max} and dosing information provided, otherwise, cite the original references (First Author, Year).

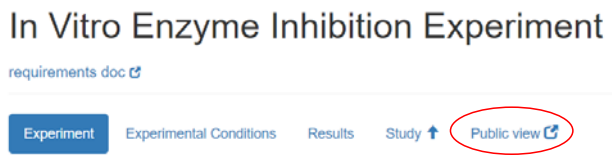






Click Submit to save the entries.

After submitting the study entry, it can be viewed as it will appear to the public by clicking on the "Public View" function near the top of the page.



Note regarding units: For consistency use the following abbreviations for the specified units below. If a unit is not listed below, use the units specified in the Study Report.

Unit	Abbreviation
hour(s)	h
minute(s)	min
second(s)	s
day(s)	day(s)
liter	L
per unit	/unit (*e.g.*, /min)
micro	µ
fold	-fold (*e.g.*, 3.2-fold)
exponents	^ (*e.g.*, 10^-6)
less than, less than or equal to	< , ≤
greater than, greater than or equal to	> , ≥
plus or minus	±

- Use molar concentration rather than moles per liter (i.e., use µM rather than µmol/L). In the case of natural products, the use if grams per liter (i.e., µg/mL) may be necessary.
- Do not convert gram concentrations (*e.g.*, µg/mL) to molar concentrations (*e.g.*, µM), even if the molecular weight of the compound is provided.
- If the units provided for a given field are different from the units in its corresponding drop-down menu, convert the units provided in the study report to the units provided in the drop-down menu. If this is not possible (for example, µg/mL cannot be converted to µM for natural product

Comment [RDB8]: Please clarify. Does this mean don't use molar units per L? Are there any conversions that the computer can do to make it simpler for the annotator and likely more accurate and consistent overall?

mixtures because there is not a molecular weight available for the conversion), add the new unit to the drop-down menu.

Table S1. Data elements and measurement types represented in the NaPDI Center repository. Data elements are preser chemical characterization of the material (Cha), metabolomics (Met), in vitro enzyme induction (Ind), inhibition (Inh), kir inhibition (Inh), iinetics (kin), clinical interaction and pharmacokinetics. Data elements are proposed to be filled "x", are depending on experiments type.

ıral Product-Drug Interactions: from Chemical Characterization to Clinical Studies",

April 2020

Experiment title
Kinetic constants for 11-hydroxy-delta-9-THC formation
Down regulation of P-gp transporter (protein) by Cannabidiol
Down regulation of P-gp transporter (protein) by Cannabidiol
Induction of BCRP transporter (protein) by Cannabidiol
Inhibition of P-gp by Cannabidiol 10ÂµM
Down regulation of P-gp transporter (protein) by Cannabidiol
Down regulation of P-gp (mRNA) by Cannabidiol
Inhibition of P-gp by Cannabidiol 10 ÂµM
Induction of BCRP transporter (protein) by Cannabidiol
Induction (mRNA) of BCRP transporter with Cannabidiol
Induction of P-gp transporter (protein) by Cannabidiol
Inhibition of P-gp by Cannabidiol 25 ÂµM
Induction of BCRP transporter (protein) by Cannabidiol
Inhibition of P-gp by Cannabidiol 25 ÂµM
Non-induction of BCRP transporter (protein) by Cannabiodiol
Induction of BCRP transporter (mRNA) by Cannabidiol
Characterization of Cannabis extract (THC)
Mean THC Plasma Concentration with High Ethanol
Mean THC Concentration with Placebo
Mean THC Plasma Concentration with High Ethanol
Inhibition of CYP2C19 by Cannabidiol
Inhibition of CYP2C19 by Cannabidiol
Inhibition of CYP2C19 by Cannabidiol
Inhibition of CYP2C19 enzyme with Cannabidiol
Inhibition of ABCC1 by Cannabinol
Negligible inhibition of ABCC1 by Cannabinol
Negligible inhibition of ABCC1 by THC
Inhibition of ABCC1 by Cannabidiol
Negligible inhibition of ABCC1 by Cannabidiol
Negligible inhibition of ABCC1 by THC
THC PK
CBD

Induction of CYP1A1 mRNA expression by 50 ÂµM cannabidiol
Non-induction of CYP1A1 mRNA expression by 50 ÂµM cannabinol
Induction of CYP1A1 mRNA expression by 50 ÂµM delta-9-THC
Mitoxantrone-THC
Mitoxantrone-CBN
Mitoxantrone-CBD
Cannabis extract (Cannabidiol) Characterization of Material
NFV+THC PK at Baseline and Day 14
IDV+THC PK at Baseline and Day 14
Inhibition of 11-hydroxylation of delta-8-THC by sulfaphenazole
Weak Inhibition of 7-alpha-hydroxylation of delta-8-THC by sulfaphenazole
Inhibition of 11-hydroxylation of cannabinol by sulfaphenazole
Weak Inhibition of 11-hydroxylation of delta-9-THC by ketoconazole
No inhibition of 7-alpha-hydroxylation of delta-8-THC by 7,8-benzoflavone
Inhibition of 8-hydroxylation of cannabinol by ketoconazole
Weak Inhibition of 11-hydroxylation of delta-9-THC by 7,8-benzoflavone
Inhibition of 7-alpha-hydroxylation of delta-8-THC by ketoconazole
Weak Inhibition of 11-hydroxylation of delta-8-THC by ketoconazole
Inhibition of 11-hydroxylation of delta-9-THC by sulfaphenazole
Inhibition of 8-beta-hydroxylation of delta-9-THC by ketoconazole
Weak Inhibition of 11-hydroxylation of delta-8-THC by 7,8-benzoflavone
No inhibition of 8-beta-hydroxylation of delta-9-THC by 7,8-benzoflavone
Weak Inhibition of 8-hydroxylation of cannabinol by sulfaphenazole
No Inhibition of 8-hydroxylation of cannabinol by 7,8-benzoflavone
Weak Inhibition of 11-hydroxylation of cannabinol by ketoconazole
Weak Inhibition of 11-hydroxylation of cannabinol by 7,8-benzoflavone
Weak Inhibition of 8-beta-hydroxylation of delta-9-THC by sulfaphenazole
CBD Effect on N-desmethylclobazam Concentrations
Stiripentol Effect on CBD, 6-OH-CBD, and 7-COOH-CBD
Clobazam Effect on CBD

CBD Effect on Stiripentol Concentrations
Clobazam Effect on 7-OH-CBD
Stiripentol Effect on 7-OH-CBD
Valproic Acid Effect on Cannabidiol Metabolites
Valproic Acid Effect on CBD
CBD Effect on Midazolam
CBD effect on CLB and N-desmethylclobazam
CBD Effect on Valproic Acid Concentrations
CBD Effect on clobazam and N-desmethylclobazam
Clobazam Effect on 6-OH-CBD
Clobazam Effect on 7-COOH-CBD

Birer-Williams et al., "A New Data Repository for Pharmacokinetic Natural Product-Drug Interactions: fr
Drug Metabolism and Disposition

Table S3. Data in the NaPDI Center repository on kratom (Mitragyna speciosa) as of April 2020

dy unique identi	Unique identifier	Natural product binomial	Experiment title	Experiment type name
NPDI-2a2LJw	NPDI-atzv7w	Mitragyna speciosa	Blood brain barrier t	In Vitro Transporter Kinetics
NPDI-4xNSSg	NPDI-_5ld1Q	Mitragyna speciosa	7-Hydroxymitragyni	In Vitro Transporter Inhibitio
NPDI-4xNSSg	NPDI-2HCqSQ	Mitragyna speciosa	Mitraphylline p-gp t	In Vitro Transporter Kinetics
NPDI-4xNSSg	NPDI-2VLnZA	Mitragyna speciosa	Mitragynine P-gp tra	In Vitro Transporter Kinetics
NPDI-4xNSSg	NPDI-iGAFkQ	Mitragyna speciosa	7-Hydroxymitragyni	In Vitro Transporter Kinetics
NPDI-4xNSSg	NPDI-mJ7zbw	Mitragyna speciosa	Inhibition of P-gp by	In Vitro Transporter Inhibitio
NPDI-4xNSSg	NPDI-ruor3g	Mitragyna speciosa	Mitraphylline P-gp t	In Vitro Transporter Kinetics
NPDI-4xNSSg	NPDI-TjrSew	Mitragyna speciosa	7-hyrdoxymitragyni	In Vitro Transporter Kinetics
NPDI-4xNSSg	NPDI-yG9O9A	Mitragyna speciosa	Mitragynine p-gp tra	In Vitro Transporter Kinetics
NPDI-6PgT2w	NPDI-FqB7Jg	Mitragyna speciosa	Kratom Metabolomi	Metabolomics
NPDI-9C7QHg	NPDI-3C6gmg	Mitragyna speciosa	Negligible inhibition	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-3eovVg	Mitragyna speciosa	Negligible inhibition	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-4_m2Gw	Mitragyna speciosa	Inhibition of UGT1A	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-4do0FA	Mitragyna speciosa	Inhibition of UGT1A	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-5VhYlA	Mitragyna speciosa	Negligible inhibition	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-9spGvg	Mitragyna speciosa	Negligible inhibition	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-bX8XPA	Mitragyna speciosa	No inhibition of UGT	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-ipamgg	Mitragyna speciosa	No inhibition of UGT	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-Nl2Cww	Mitragyna speciosa	Negligible inhibition	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-NZQ3aw	Mitragyna speciosa	Negligible inhibition	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-pMOhyQ	Mitragyna speciosa	Inhibition of UGT in	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-Q5Hs5A	Mitragyna speciosa	No inhibition of UGT	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-u96XKg	Mitragyna speciosa	Negligible inhibition	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-Ve-SYA	Mitragyna speciosa	No inhibition of UGT	In Vitro Enzyme Inhibition
NPDI-9C7QHg	NPDI-ZTY8Qw	Mitragyna speciosa	Inhibition of UGT2B	In Vitro Enzyme Inhibition
NPDI-Algmhw	NPDI-_DqAGQ	Mitragyna speciosa	Control dimethyl sul	In Vitro Enzyme Induction
NPDI-Algmhw	NPDI-_MysYg	Mitragyna speciosa	Mitragynine non-inc	In Vitro Enzyme Induction
NPDI-Algmhw	NPDI-_rs20g	Mitragyna speciosa	Control dimethyl sul	In Vitro Enzyme Induction
NPDI-Algmhw	NPDI--0S--Q	Mitragyna speciosa	Dimethyl sulfoxide r	In Vitro Enzyme Induction
NPDI-Algmhw	NPDI-5_pf-w	Mitragyna speciosa	Mitragynine inducti	In Vitro Enzyme Induction
NPDI-Algmhw	NPDI-7sdBtQ	Mitragyna speciosa	Mitragynine inducti	In Vitro Enzyme Induction
NPDI-Algmhw	NPDI-dQtQ2g	Mitragyna speciosa	Control dimethyl sul	In Vitro Enzyme Induction
NPDI-Algmhw	NPDI-exquAQ	Mitragyna speciosa	Control dimethyl sul	In Vitro Enzyme Induction
NPDI-Algmhw	NPDI-J0Eryw	Mitragyna speciosa	Mitragynine inducti	In Vitro Enzyme Induction

Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Inhibition of CYP2C9, CYP2D6, and CYP3A activity by Mitragynine and Kratom extracts
Metabolite profiling and identification of enzymes responsible for the metabolism of mitragynine, the major alkalc
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids

Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Exploration of cytochrome P450 inhibition mediated drug-drug interaction potential of kratom alkaloids
Evaluation of the Effects of Mitragyna speciosa Alkaloid Extract on Cytochrome P450 Enzymes Using a High Throug
Evaluation of the Effects of Mitragyna speciosa Alkaloid Extract on Cytochrome P450 Enzymes Using a High Throug
Evaluation of the Effects of Mitragyna speciosa Alkaloid Extract on Cytochrome P450 Enzymes Using a High Throug

Evaluation of the Effects of Mitragyna speciosa Alkaloid Extract on Cytochrome P450 Enzymes Using a High Throug
The inhibitory effects of mitragynine on P-glycoprotein in vitro
The inhibitory effects of mitragynine on P-glycoprotein in vitro
The inhibitory effects of mitragynine on P-glycoprotein in vitro
The inhibitory effects of mitragynine on P-glycoprotein in vitro
The inhibitory effects of mitragynine on P-glycoprotein in vitro
The inhibitory effects of mitragynine on P-glycoprotein in vitro
The inhibitory effects of mitragynine on P-glycoprotein in vitro
The inhibitory effects of mitragynine on P-glycoprotein in vitro
The inhibitory effects of mitragynine on P-glycoprotein in vitro
The inhibitory effects of mitragynine on P-glycoprotein in vitro
Evaluation of selected Malaysian medicinal plants on phase I drug metabolizing enzymes, CYP2C9, CYP2D6 and CYF
Evaluation of selected Malaysian medicinal plants on phase I drug metabolizing enzymes, CYP2C9, CYP2D6 and CYF
Evaluation of selected Malaysian medicinal plants on phase I drug metabolizing enzymes, CYP2C9, CYP2D6 and CYF
Evaluation of selected Malaysian medicinal plants on phase I drug metabolizing enzymes, CYP2C9, CYP2D6 and CYF
Evaluation of selected Malaysian medicinal plants on phase I drug metabolizing enzymes, CYP2C9, CYP2D6 and CYF
Evaluation of selected Malaysian medicinal plants on phase I drug metabolizing enzymes, CYP2C9, CYP2D6 and CYF
Characterization of Kratom material
Inhibitory effect of mitragynine on human cytochrome P450 enzyme activities
Inhibitory effect of mitragynine on human cytochrome P450 enzyme activities
Inhibitory effect of mitragynine on human cytochrome P450 enzyme activities
Inhibitory effect of mitragynine on human cytochrome P450 enzyme activities
Inhibitory effect of mitragynine on human cytochrome P450 enzyme activities
Inhibitory effect of mitragynine on human cytochrome P450 enzyme activities
Inhibitory effect of mitragynine on human cytochrome P450 enzyme activities
Inhibitory effect of mitragynine on human cytochrome P450 enzyme activities
Inhibitory effect of mitragynine on human cytochrome P450 enzyme activities
P-glycoprotein interactions of novel psychoactive substances - Stimulation of ATP consumption and transport acro
P-glycoprotein interactions of novel psychoactive substances - Stimulation of ATP consumption and transport acro

Overview of Supplemental data for Birer, C *et al*. A New Data Repository for Pharmacokinetic Natural Product-Drug Interactions: from Chemical Characterization to Clinical Studies. Drug Metabolism and Disposition

Table S1. Data elements of natural products chemistry studies and of *in vitro* and clinical pharmacokinetic NPDI studies. Data elements are presented for all experiment types of the NaPDI Center repository, for chemical characterization of the material (Cha), metabolomics (Met), *in vitro* enzyme induction (Ind), inhibition (Inh), kinetics (kin), screen (Scr), *in vitro* transporter induction (Ind), inhibition (Inh), kinetics (kin), clinical interaction and pharmacokinetics. Data elements are proposed to be filled "x", are required to be filled "x" or are not available to be filled "-" depending on experiment type.

Table S2. Data in the NaPDI Center repository on cannabis as of April 2020

Table S3. Data in the NaPDI Center repository on kratom as of April 2020

Supplementary material.

1. An example standard operating procedures for NaPDI Repository Data Entry - In vitro Enzyme Inhibition Studies
2. A screen capture video (now audio) showing various features of the NaPDI Repository user interface.
